HOTEL RESERVATION

Reservation Page:

Check-in:

- Email – if we not mention @ it want to show error.
- Reservation id – alpha numeric like (BH001,BH002….)
- After check-in reservation details like reservation id, name, phone, checkin date, checkout date, room type, bedding type, total cost, initial payment. And go to home button.

Checkout:

- In first page, reservation id and submit button.
- In next page, it wants show the reservation id, customer name, phone, check-in date, checkout date, room type, bedding type, total cost, initial payment.
- Those who pay more than 75,000 and who stays more than 10 days it wants to show the spin wheel options discount up to 15% it wants to reduce in the total cost.
- And then it wants to generate the invoice with the invoice number, reservation id, customer name, date, check-in date, checkout date, email id, bedding type, room type, no.of adult and children .

Cancellation:

- In first page, reservation id and submit button.
- In next page, it wants show the reservation id, customer name, phone, check-in date, checkout date, room type, bedding type, total cost, initial payment.
- In the initial payment it has to return only 25% to the customer and in that also want generate invoice.

In database when we book hotel previous it wants to show status as pending, if we book on same and check-in on same day it wants to show as check-in, if we checkout it wants to show data as checkout, if we cancel it want to show as cancel.

In admin

- First page as admin mail id and password after we enter it want to redirect to next page.
- in next page it wants to all the customer info and reservation info.
- Below it wants all to show the room availability in each it has only 40 rooms.

- All the customer and reservation and admin info want to store in backend.
- In last it wants show logout it wants to redirect to home page.

Signin/Login

- In first page it wants to show signin details like mailid and password below it want to show the login.
- If we click login mailid and password want to enter and it want move to reservation page.
- Already they enter the mail id in check-in with the help of the again the data automatically fill in check-in. except the check-in and checkout date.
- This values also want to store in database.
